

STOP GRASS FIRES, PROTECT YOUR PERSONNEL

FAV Systems Inc. FireBall has been designed to eliminate the use of flare guns to ignite intermittent flares. The use of flare guns causes environmental damage including costly grass and forest fires which can occasionally be fatal. With the FAV Systems Inc. You have no risk of flare shots flying into the grass or bouncing back down the shot tube and burning personnel with hot sulphur.

FAV Systems FireBall can be installed on any stack that only requires intermittent ignition. It's perfect for both new flare stacks that are being fabricated, and existing flare stacks that are currently in the field. Featuring a threaded connection, all that is required for installation is an union.

OPERATION

1.- Turn open fuel valve and wait 10 seconds

2.- Push the piezo spark generator, there will be an internal bang as the Fire Ball is launched to the flare tip, to light flare gas

3.- After the flare is lit, turn off the fuel valve
