FLARE DEBRIS SHIELD
PERSONAL SAFETY

USE YOUR HEAD FOR THINKING, NOT FOR STOPPING FALLING DEBRIS

FAV Systems knows safety comes first. FAV Systems Inc. also knows that there can be danger above you when you are doing maintenance to flare ignition devices. Lots of flares contain H₂S gas and burn very corrosively during oxidation.

As these flares operate for long periods of time, they can deteriorate the flare tip wind shrouds or pilot nozzles that are subjected to high heat and H₂S corrosion. When you retract the pilot or ignition system these loosened pieces of debris can fall from great heights and cause death or injury. Although there has never been an incident, there is the potential for one to occur. By installing the FAV Systems Flare Debris Shield, you eliminate the chance that you will be hit with falling debris. Since there has not been a reported accident yet, that means a lot of people have been really lucky.

Be Pro-active, install a shield on your location and be safe.
