

RIGHT SIDE UP THIEF HATCH
 PRESSURE VACUUM THIEF HATCHES
 THAT REALLY WORKS!

SOLVING LEAKAGE PROBLEMS

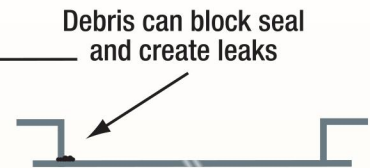

FAV Systems Inc. has engineered the Right Side Up Thief Hatch to eliminate problems associated with thief hatches in general. All other thief hatches incorporate a vacuum valve that is hanging in the thief hatch valve upside down. Being that the valve is upside down, all rust, debris, ice, water and any blow debris is sitting on the valve pallet, where if the valve opens, debris falls right in between the seat and the valve pallet causing continuous leaking. Once the valve opens, the chance of junk getting between the seat is very high and often happens.

FAV Systems thought that if producers are spending money to solve a problem, they may as be able to select a product that will actually work. Our engineering team has designed the Right Side Up valve assembly to insure that your problem is solved when you buy our product. Shown below is the working theory of our Right Side Up Thief Hatch. Make your own conclusion.
