

## STAYS-TIGHT GAUGE CABLE

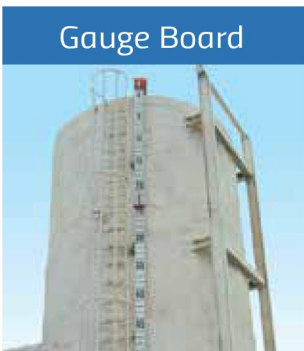

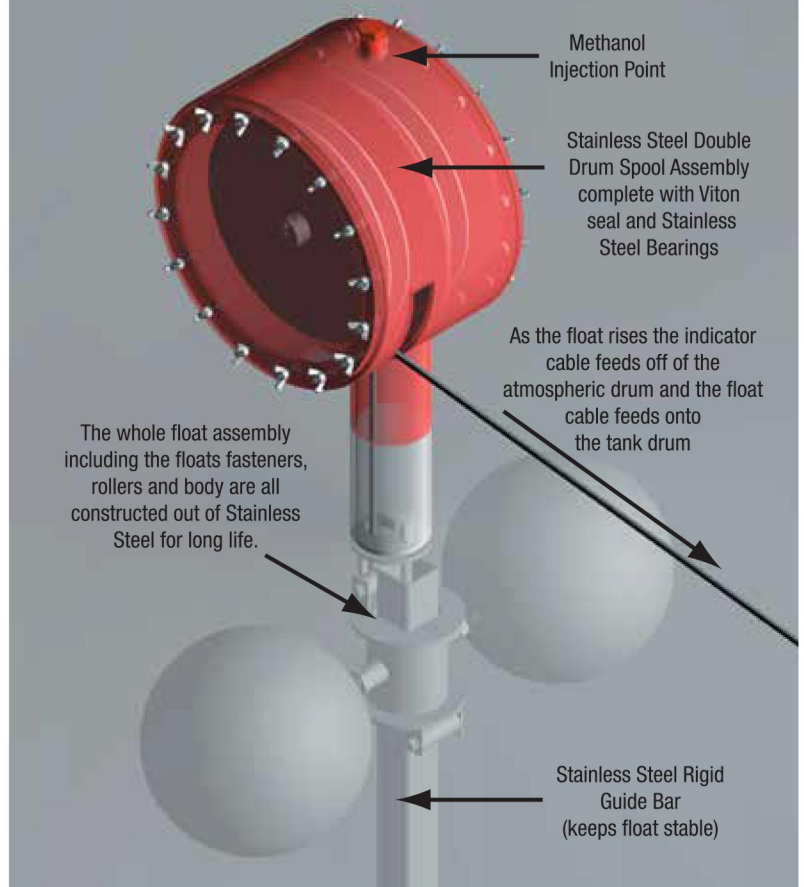

# WITH INDICATOR BOARD FOR EASY CONTROL

The FAV Systems Inc. Stays-Tight Cable Seal is designed to allow the level gauge cable to spool in and out of the double drum system without leaking vapors. How this is accomplished is the drum section connected to the tank vapor space is a sealed compartment that is divided from the other drum section by a stainless steel shaft, stainless steel bearings and a Viton seal that seals on the stainless steel shaft. This Viton and stainless steel contact point is non-corrosive and very durable.

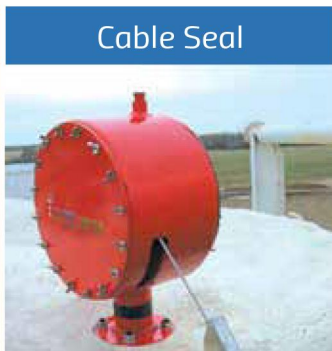

The outer drum cable spools in and out, showing your fluid level on the vertical indication board mounted on the outside of your tank. This cable seal can be purchased as separate item to be added to existing tanks that have an indication board but no cable seal, or they can be purchased as a package to include an internal float, a guide and outer indication board. FAV Systems can custom build a complete package to suit your needs as required.

The FAV Systems Stays-Tight Cable Seal will retain your gas. Be green, keep the air clean.

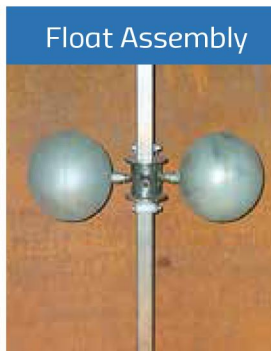

### Seal your existing or New tanks tight with The FAV Systems Stay-Tight Gauge Cable Seal
